Prosamine® is an affordable joint supplement designed to provide the nutrients needed to build and restore joint tissue. It provides many of the basic building blocks used in the natural regeneration of connective tissues, such as cartilage, tendons, and ligaments. Many factors such as age, trauma, surgery or arthritis may influence how rapidly injured connective tissue heals.

Glucosamine, through its increased availability, stimulates the chondrocytes in the cartilage to make more hyaluronic acid that goes into the ground substance of the tissue, building a wetter, plumper cartilage and providing lubrication. Studies also show that glucosamine will lead to the production of more glycosaminoglycans, which are then incorporated into proteoglycans. These proteoglycans in the cartilage hold water and give it its shock-absorbing properties. The results are improved joint flexibility, function and comfort accompanied by greater mobility. In addition to the high concentration of glucosamine, Prosamine® also incorporates hydroxyproline, which is a scarce amino acid not often found in other joint products. Hydroxyproline is crucial for joint tissue synthesis and repair.

Q: How do I respond when clients want to buy glucosamine for their cat or dog from health food stores or local discount stores?

A: There are many sources and choices for glucosamine products. However, it is important for veterinarians and their clients to know that quality ingredients, which are safe for animal use, are present in the amount shown on the label. You may be aware of the Consumerlabs.com report in which several glucosamine/chondroitin sulfate products were tested and found to be missing a portion or all of the claimed amounts. Prosamine® is competitively priced and tested by an independent laboratory, so your clients can afford a veterinary product and get the quality assurance too.

"My Husky will be 16 this summer. I tried Rimadyl but this was not a healthy solution for her due to an increase in liver enzymes. Consequently, I started her on Prosamine about three years ago and she has been very responsive since." — Craig

"I started my 15-year old dog on Prosamine 4 years ago. I crush the tablet into my dog's food. After starting him on Prosamine, Juno started moving his back legs and is now walking again. My old dog has been doing so well for these past 4 years." — Julia, Arizona

"We live in GA and have a cherished 16-yr. old American Eskimo Spitz. About 5-6 years ago, we noticed she was having trouble walking. She had always been extremely active, so we were very concerned. We found a vet who recommended Prosamine. We were very skeptical. Prosamine has been a true Godsend! Keesha has improved 100%! She is still a little stiff in the mornings when she wakes up, but she runs and plays like a puppy! We cannot thank you enough for this product as it has changed our lives! I would highly recommend this product to anyone who has an aging friend!" — Linda & Brian, Georgia
